

# Computing Infrastructures - Notes

260236

March 2024

## Preface

Every theory section in these notes has been taken from two sources:

- The Datacenter as a Computer: Designing Warehouse-Scale Machines, Third Edition. [1]
- Quantitative System Performance: Computer System Analysis Using Queueing Network Models. [2]

# 1 Hardware Infrastructures

## 1.1 System-level

### 1.1.1 Computing Infrastructures and Data Center Architectures

There's no single definition of a Data Center, but it can be summarized as follows.

#### Definition 1

**Data Centers** are buildings where multiple servers and communication gear are co-located because of their common environmental requirements and physical security needs, and for ease of maintenance. [1]

#### Definition 2

A **Computing Infrastructure** (or IT Infrastructure) is a technological infrastructure that provides hardware and software for computation to other systems and services.

A number of computing infrastructures exist:

- **Cloud** offers virtualized computing, storage and network resources with highly-elastic capacity.
- **Edge Servers** are on-premises hardware resources that perform more compute-intensive data processing.  
In other words, an edge server is a piece of hardware that performs data computation at the end (or “edge”) of a network. Like a regular server, an edge server can provide compute, networking, and storage functions.<sup>1</sup>
- **IoT and AI-enabled Edge Sensors** are hardware devices where the data acquisition and partial processing can be performed at the edge of the network.

---

<sup>1</sup>More info [here](#).

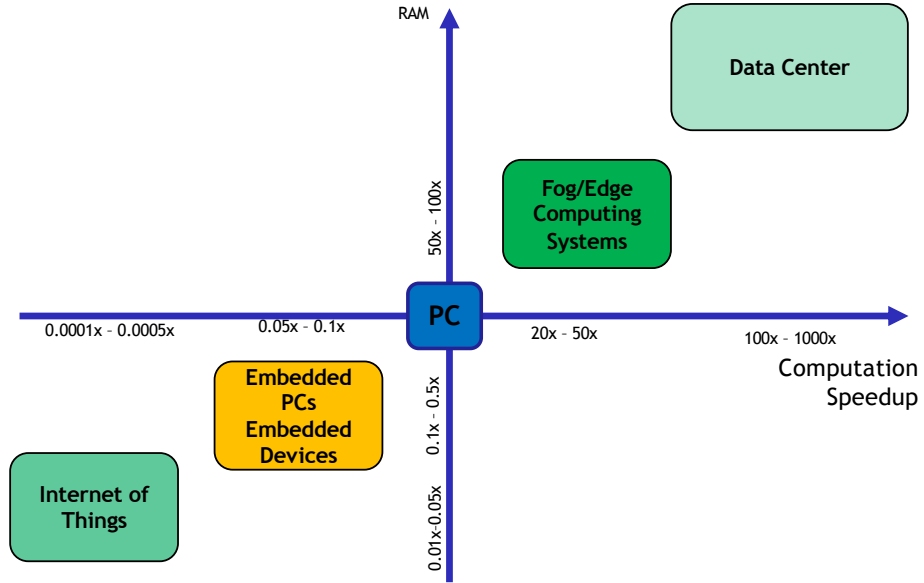

Figure 1: An **example** of Computing Infrastructures. [4]

The **Computing Continuum**, a novel paradigm that extends beyond the current silos of cloud and edge computing, can enable the seamless and dynamic deployment of applications across diverse infrastructures. [3]

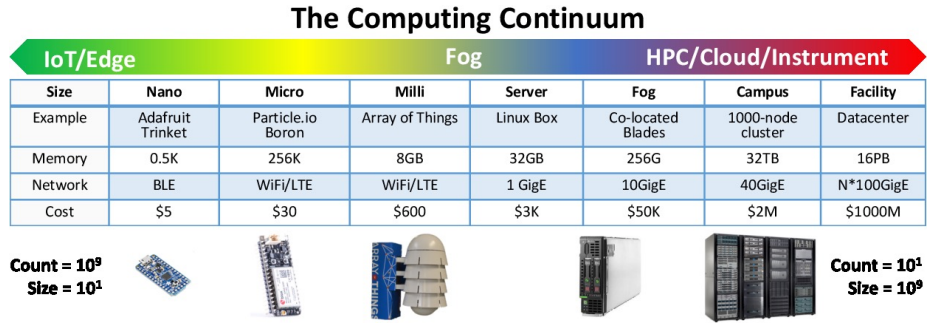

Figure 2: The Computing Continuum. [4]

In the following pages, we analyze the computing infrastructures mentioned in the previous example.

## **Data Centers**

The definition of a Data Centers can be found on page 4.

### **✓ Data Centers Advantages**

- Lower IT costs.
- High Performance.
- Instant software updates.
- “Unlimited” storage capacity.
- Increased data reliability.
- Universal data access.
- Device Independence.

### **🚫 Data Centers Disadvantages**

- Require a constant internet connection.
- Do not work well with low-speed connections.
- Hardware Features might be limited.
- Privacy and security issues.
- High power Consumption.
- Latency in taking decision.

## Internet-of-Things (IoT)

An **Internet of Things (IoT)** device is any everyday object embedded with sensors, software, and internet connectivity.

This allows to collect and exchange data with other devices and systems, typically over the internet, with limited need of process and store data.

Some **examples** are [Arduino](#), [STM32](#), [ESP32](#), [Particle Argon](#).

### ✓ Internet-of-Things Advantages

- Highly Pervasive.
- Wireless connection.
- Battery Powered.
- Low costs.
- Sensing and actuating.

### 🚫 Internet-of-Things Disadvantages

- Low computing ability.
- Constraints on energy.
- Constraints on memory (RAM/FLASH).
- Difficulties in programming.

---

## Embedded (System) PCs

An **Embedded System** is a computer system, a combination of a computer processor, computer memory, and input/output peripheral devices, that has a dedicated function within a larger mechanical or electronic system.

A few **examples**: [Odroid](#), [Raspberry](#), [jetson nano](#), [Google Coral](#).

### ✓ Embedded System Advantages

- Persuasive computing.
- High performance unit.
- Availability of development boards.
- Programmed as PC.
- Large community.

### 🚫 Embedded System Disadvantages

- Pretty high power consumption.
- (Some) Hardware design has to be done.

## Edge/Fog Computing Systems

The key **difference** between **Fog Computing** and **Edge Computing** is associated with the location **where the data is processed**:

- In **edge computing**, the data is processed closest to the sensors.
- In **fog computing**, the computing is moved to processors linked to a local area network (IoT gateway).

Edge computing places the intelligence in the connected devices themselves, whereas, fog computing puts in the local area network.
