

Numerical Linear Algebra - Notes - v0.1.0-dev

260236

September 2024

Preface

Every theory section in these notes has been taken from the sources:

- Course slides. [\[1\]](#)

About:

 [GitHub repository](#)

These notes are an unofficial resource and shouldn't replace the course material or any other book on numerical linear algebra. It is not made for commercial purposes. I've made the following notes to help me improve my knowledge and maybe it can be helpful for everyone.

As I have highlighted, a student should choose the teacher's material or a book on the topic. These notes can only be a helpful material.

Contents

1 Preliminaries	4
1.1 Notation	4
1.2 Matrix Operations	5
Index	8

1 Preliminaries

This section introduces some of the basic topics used throughout the course.

1.1 Notation

We try to use the same notation for anything.

- **Vectors.** With \mathbb{R} is a set of real numbers (scalars) and \mathbb{R}^n is a space of column vectors with n real elements.

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ \vdots \\ x_n \end{bmatrix}$$

Vectors with all zeros and all ones:

$$\mathbf{0} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix} \quad \mathbf{1} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ \vdots \\ 1 \end{bmatrix}$$

- **Matrices.** With $\mathbb{R}^{m \times n}$ is a space of $m \times n$ matrices with real elements:

$$\mathbf{A} = \begin{bmatrix} a_{1,1} & a_{1,2} & \cdots & a_{1,n} \\ a_{2,1} & a_{2,2} & \cdots & a_{2,n} \\ \vdots & & & \\ a_{m,1} & a_{m,2} & \cdots & a_{m,n} \end{bmatrix}$$

Identity matrix $\mathbf{I} \in \mathbb{R}^{n \times n}$:

$$\mathbf{I} = \begin{bmatrix} 1 & 0 & \cdots & 0 \\ 0 & 1 & \cdots & 0 \\ \vdots & & & \\ 0 & 0 & \cdots & 1 \end{bmatrix} = [\mathbf{e}_1 \quad \mathbf{e}_2 \quad \mathbf{e}_n]$$

Where \mathbf{e}_i , $i = 1, 2, \dots, n$ are the canonical vectors.

$$\mathbf{e}_i = [0 \quad 0 \quad \cdots \quad 1 \quad \cdots \quad 0 \quad 0]^T$$

Where 1 is the i -th entry.

1.2 Matrix Operations

Some basic matrix operations:

- **Inner products.** If $\mathbf{x}, \mathbf{y} \in \mathbb{R}^n$ then:

$$\mathbf{x}^T \mathbf{y} = \sum_{i=1, \dots, n} x_i y_i$$

For real vectors, the commutative property is true:

$$\mathbf{x}^T \mathbf{y} = \mathbf{y}^T \mathbf{x}$$

Furthermore, the vectors $\mathbf{x}, \mathbf{y} \in \mathbb{R}^n$ are **orthogonal** if:

$$\mathbf{x}^T \mathbf{y} = \mathbf{y}^T \mathbf{x} = 0$$

And finally, some useful properties of matrix multiplication:

1. Multiplication by the *identity* changes nothing.

$$A \in \mathbb{R}^{n \times m} \Rightarrow \mathbf{I}_n A = A = A \mathbf{I}_m$$

2. Associativity:

$$A(BC) = (AB)C$$

3. Distributive:

$$A(B + D) = AB + AD$$

4. No commutativity:

$$AB \neq BA$$

5. Transpose of product:

$$(AB)^T = B^T A^T$$

- **Matrix powers.** For $A \in \mathbb{R}^{n \times n}$ with $A \neq \mathbf{0}$:

$$A^0 = \mathbf{I}_n \quad A^k = \underbrace{A \cdots A}_{k \text{ times}} = AA^{k-1} \quad k \geq 1$$

Furthermore, $A \in \mathbb{R}^{n \times n}$ is:

- **Idempotent** (projector) $A^2 = A$
- **Nilpotent** $A^k = \mathbf{0}$ for some integer $k \geq 1$

- **Inverse.** For $A \in \mathbb{R}^{n \times n}$ is **nonsingular** (**invertible**), if exists A^{-1} with:

$$AA^{-1} = \mathbf{I}_n = A^{-1}A \quad (1)$$

Inverse and transposition are interchangeable:

$$A^{-T} \triangleq (A^T)^{-1} = (A^{-1})^T$$

Furthermore, an inverse of a product for a matrix $A \in \mathbb{R}^{n \times n}$ can be expressed as:

$$(AB)^{-1} = B^{-1}A^{-1}$$

Finally, remark that if $\mathbf{0} \neq \mathbf{x} \in \mathbb{R}^n$ and $A\mathbf{x} = \mathbf{0}$, then A is **singular**.

- **Orthogonal matrices.** Given a matrix $A \in \mathbb{R}^{n \times n}$ that is *invertible*, the matrix A is said to be **orthogonal** if:

$$A^{-1} = A^T \Rightarrow A^T A = \mathbf{I}_n = A A^T$$

- **Triangular matrices.** There are two types of triangular matrices:

1. **Upper triangular matrix:**

$$\mathbf{U} = \begin{bmatrix} u_{1,1} & u_{1,2} & \cdots & u_{1,n} \\ 0 & u_{2,2} & \cdots & u_{2,n} \\ \vdots & & & \\ 0 & 0 & \cdots & u_{n,n} \end{bmatrix}$$

\mathbf{U} is **nonsingular** if and only if $u_{ii} \neq 0$ for $i = 1, \dots, n$.

2. **Lower triangular matrix:**

$$\mathbf{U} = \begin{bmatrix} l_{1,1} & 0 & \cdots & 0 \\ l_{2,1} & l_{2,2} & \cdots & 0 \\ \vdots & & & \\ l_{n,1} & l_{n,2} & \cdots & l_{n,n} \end{bmatrix}$$

\mathbf{L} is **nonsingular** if and only if $l_{ii} \neq 0$ for $i = 1, \dots, n$.

- **Unitary triangular matrices.** Are matrices similar to the lower and upper matrices, but they have the main diagonal composed of ones.

1. **Unitary upper triangular matrix:**

$$\mathbf{U} = \begin{bmatrix} 1 & u_{1,2} & \cdots & u_{1,n} \\ 0 & 1 & \cdots & u_{2,n} \\ \vdots & & & \\ 0 & 0 & \cdots & 1 \end{bmatrix}$$

2. **Unitary lower triangular matrix:**

$$\mathbf{U} = \begin{bmatrix} 1 & 0 & \cdots & 0 \\ l_{2,1} & 1 & \cdots & 0 \\ \vdots & & & \\ l_{n,1} & l_{n,2} & \cdots & 1 \end{bmatrix}$$
